

# Electrical Safe Work Program Development

[www.kensington-consulting.com](http://www.kensington-consulting.com)

Kensington Consulting can help you create a program containing general requirements, work procedures and information for all electrical work at your facility. We can help you meet NFPA70E best practice requirements: by defining safe work practices and use requirements for all people who work on or near electrically energized equipment as part of their normal job duties, establishing training requirements for qualifying and authorizing employees who work on or near energized electrical circuits and components, and, establishing a process for evaluating the hazards of every energized electrical work task and for providing commensurate hazard controls.

Our experience not only includes development of electrical safe work program materials, we can also help your engineering staff in the preparation of coordination studies which lead to detailed arc flash analysis.
